PROFESSIONAL SUMMARY

AI Engineer and full-stack developer who builds complete AI-powered applications: the interfaces people use and the backend systems that make them reliable. Experienced with React, Next.js, TypeScript, Node.js, Go, PostgreSQL, Redis, REST APIs, and AI services including Groq, OpenAI, Anthropic Claude, and Cerebras. Focused on resilient AI workflows, answer validation, prompt-injection defence, data privacy, rate limiting, cost-aware model selection, accessible interfaces, and production-ready delivery. Brings transferable cloud and deployment foundations for AWS-oriented frontend, backend, and AI engineering teams.

TECHNICAL SKILLS

AI Engineering: AI application development, prompt engineering, Vercel AI SDK, OpenAI, Anthropic Claude, Groq, Cerebras, Llama, answer validation, prompt-injection defence, AI failover, cost-aware model routing, data redaction

Frontend Engineering: React, Next.js, TypeScript, JavaScript, Tailwind CSS, React Query, Zustand, responsive design, accessibility, performance optimization, Framer Motion

Backend Engineering: Node.js, Go, REST APIs, Express.js, PostgreSQL, MongoDB, Redis, Supabase, authentication, rate limiting, validation with Zod

Cloud, DevOps, and Quality: Docker, Vercel, Git, GitHub, Vitest, Jest, ESLint, logging, health checks, deployment workflows, API integration, environment-based configuration, AWS-ready foundations

CERTIFICATIONS

Certified Nomba Developer: Nomba x DevCareer; Nomba Developer Certification and Hackathon 2026; Issued July 1, 2026; Credential ID NMB-2026-XX6Z9S

AI ENGINEERING

- Implemented AI application workflows with Groq, OpenAI, Anthropic Claude, Cerebras, and the Vercel AI SDK
- Designed provider failover and deterministic fallback paths for degraded or unavailable AI services
- Added output validation, prompt-injection controls, personal-data redaction, and request rate limiting
- Applied cost-aware model routing so simple tasks use efficient models and complex tasks receive more capable models

AWS-READY CLOUD FOUNDATIONS

- Cloud-ready application foundations: Dockerized Node.js and Go services, stateless REST APIs, environment-based configuration, and health checks
- Transferable AWS service patterns across compute, RDS/PostgreSQL, ElastiCache/Redis, S3-style object storage, and CloudWatch-oriented logging
- Security-minded delivery with validation, least-privilege thinking, rate limiting, secrets separation, and observable failure paths

PRODUCT ENGINEERING

- Built responsive React and Next.js interfaces that work clearly across phones, tablets, and desktop screens
- Implemented Node.js and Go services with PostgreSQL, MongoDB, Redis, Supabase, and REST API integrations
- Added automated checks, structured logging, validation, and deployment workflows to improve release confidence
- Communicated technical decisions clearly across remote collaboration and supported junior developer growth

EXPERIENCE

Software Engineer & Technical Mentor | MercuryX

Oct 2025 - Present

I take features from specification through implementation, review, and release to production users. I also mentor the junior engineers on the team, which means defending design decisions out loud and turning implicit conventions into written ones.

- Take features from first idea through building, testing, and release to real users.
- Teach the junior developers on the team and review their work.

Backend Engineering Programme - Go | Learn2Earn

Nov 2025 - Dec 2025

An intensive Go programme covering concurrency, HTTP service design, and the structure of a backend that stays predictable as load rises rather than degrading unpredictably.

- Intensive programme in Go, a language built for handling many users at once.
- Covered designing the behind-the-scenes half of an app to stay fast under load.

Full Stack Developer | Vivaking Technologies

Mar 2025 - Nov 2025

I shipped client features end to end: React interfaces, Node and MongoDB services, and the API contracts joining them. A recurring part of the work was profiling the paths users hit most often and cutting the work done on them.

- Built complete features for clients: the screens, the storage, and everything in between.
- Made the parts people used most noticeably faster.
